-!- FUNCTION: THE S-LAYER IS A PARAYSTALLINE MONO-LAYERED ASSEMBLY
OF PROTEINS WHICH COAT THE SURFACE OF BACTERIA.
-!- SUBCELLULAR LOCATION: CELL WALL. THIS BACTERIUM IS COVERED BY A
S-LAYER WITH OBLIQUE (P2) SYMMETRY.
                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Reductionly distinct methyl-coenzyme M reductases in Methanobacterium thermoautotrophicum strain Marburg and delta H.";

Bur. J. Bloochem. 194:871-877(1990)

-I- FUNCTION: Reduction of methyl-coenzyme M (2-(methylthio) ethanesulfonic acid) with 7-mercaptoheptanoylthreonine phosphate to methans and an hetezodisulfide.

-I- CATALYITC ACTIVITY: CH(3)-S-COM + H-S-HTP = CH(4) + COM-S-S-HTP.

-I- COFACTOR: THE ENZYME COMPLEX BINDS TICHTLY (BUT NOT COVALENTLY)

TO TWO MOLECULES OF COENZYME F430. F430 IS A YELLOW NICKEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                  This bequence represents comprementative determined of the light chain of murine anti-CD23 (FCERII) monoclonal antibody Cl1 (see also AAY32262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of Cl1 light and heavy chain CDS (see AAY3224-59) to render them capable of binding to the CD23 (type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowed lalesage, ulocarative colitis, Crohn's disease, Sogren's syndrome, allergies allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, cathma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and

AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6A12, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic caid from 3H-phenyl occaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoceter transition state analogue. Antibody 6A12 has a per minute KCat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA; benzoic acid, phenyl cocaine; immunogenic conjugate, reduction, cocaine, treatment,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies particularly for the treatment of an subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of occaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

AAW39975-77 represent the sequences of the light chain complementarity determining regions (CDRs) of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. These antibodies were found to have CDRs of the present sequence. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                      Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.
                                                                                                                                                                                              Light chain CDR1 of a catalytic antibody capable of degrading cocaine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW39839-41 represent the sequences of the light chain complementarity determining regions (CDR8) of the catalytic antibody 8G4E, which is able to degrade cocaine. A series of cocaine transition state analogues (TSA8) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodises were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 8G4E antibody was identified using TSA3, and has a per minute Kcat of 0.12. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vařiable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2AlO, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2AlO antibody was identified using TSAl, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AlO has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo
                                                                                                                                                                                                                                                                                                                                                        New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ۲,

Best Loca Matches RESULT 10 Mus AAB86292 ð 셤 The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides calls), comprising using a library of two different polynucleotides to encoding different immunoglobulin binding protein (IRBP) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transfected cells, to generate an IBBP that binds to a ligand, and transformed plant cells are selected, and at least 75% sequence identity to a framework region (RR) of a native IGM, IGG, IGA, IGD, IGE, IGY, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of IGBPs having desired characteristics. The present sequence is a mammalian immunoglobulin derived peptide that may be incorporated into an IGBP of ö Preparing immunoglobulin binding protein array in plant cells by transforming the cells with different polynucleotides encoding binding protein polypeptides specific to ligand, selecting plant cells for Gaps Complementarity determining region, CDR; monoclonal antibody; MAb; hepatitis C virus; HCV; protease; binding site. ö Peptide CDR-L1 derived from anti-HCV Ser/Thr protease MAb 8D4. rhis invention describes novel antibodies (Ab) in which the variable region (VR) of at least one chain and/or the VR of at least one heavy chain includes at least one of 7 specified sequences, or fragments of these sequences, or contain at least one light chain and/or heavy chain encoded by specific nucleic acid sequences (I) and (II), reproduced, or their fragments. The products of the invention have antitumor and immunomodulatory activity. Ab, or other antibodies that recognize the same antigen, are used: (1) to identify cognate antigens, comparation, e.g. in an extracorporeal system; (iii) for generating additional antibodies able to label PC; and (iv) for treating autoimmune diseases and/or tumores, e.g. multiple myeloma, lymphoma and/or plastocytoma. Ab are specific for mature PC, i.e. they do not recognize plastocytoma. Ab are specific for mature PC, i.e. they do not recognize plastocytoma. Ab are specific for mature productions as immunogens. Cherospeutic agents, they should show fewer side effects than conventional chemotherapeutic agents. This sequence represents the Wue-1 antibody
                                                                                                                                                                                                                                                                                  ö
                                               This sequence represents a peptide derived for the sequence of the light chain variable region complementarity determining region (CDR)-1 of the anti-hepatitis C virus (HCV) Ser/Thr protease monoclonal antibody (MAb) 8D4 protein. The invention relates to the use of partial peptides (AAY14348-Y14353) from the MAb 8D4 for inhibiting HCV serine protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibody; Wue-1; variable region; light chain; heavy chain; antitumor; immunomodulatory; cognate antigen identification; autoimmune disease; tumor; multiple myeloma; lymphoma; plastocytoma; CDR-1.

                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a chimeric antibody, or an Fv-type single-chain fragment, derived from the murine monoclonal antibody or single-chain fragment, derived from the murine monoclonal antibody in CRS expressed by hybridoma ECCC 97061101. It contrains the CDRS (complementarity determining regions) of IOR CS and human constant regions, in both heavy and light chains. The IOR CS antibody specifically binds to the IOR C2 antigen which is expressed on malignant and normal coloractal cells. The invention also encompasses a cell line which expresses the humanised IOR C5 antibody; host cells which expresses the coloractal cells. The invention also encomposition for treatment, location or in vivo identification of malignant tymours of colon and rectum, including their metastases and recurrences, containing the humanised antibody or the Fv fragment thereof, plus an excipient; and a method antibody or the Fv fragment thereof, plus an excipient, and method antibody or the fragment and including their metastases or recurrences, and for in vivo diagnosis of tumours of reat malignant tumours of the colon or rectum, including their metastases or recurrences, and for in vivo diagnosis, (imaging) of tumours, particularly when radiolabelled.
                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant antibody, or single-chain fragment, derived from murine monoclonal IOR C5, useful for treatment and diagnosis of colo-rectal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monoclonal antibody IOR C5; hybridoma BCCC 97061101; mouse; humanised; IOR C2 antigen; colorectal cancer; tumour; metastasis; therapy; drug targetting; imaging; diagnosis; extostatic; VL; light chain variable region;

The chimeric Abs can be used both in vivo and in vitro and, since they have very low immunogenicity as compared with mouse Abs, they can be administered to humans for diagnostic and therapeutic purposes. They are also more stable and show a longer half-life in the blood as compared with the original mouse Abs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gapa

The invention relates a humanised antibody that specifically binds an epitope contained within positions 13-28 of amyloid beta peptide, beta. The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of toxic soluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes their fragments are used for the manufacture of a medicant. This includes tissues for the treatment of clinical/pre-clinical Alzheimer's disease, Down's syndrome or pre clinical cerebral amyloid angiopathy. Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/reverse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is human light chain CDR1 (complementarity determining region 1) used to humanise the mouse monoclonal antibody 266 to produce Hu266.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mouse; graft rejection; CC chemokine receptor 2 antagonist; CCR2 antagonist; anti-CCR2 antibody; kidney transplant; liver transplant; lung transplant; pancreas transplant; bowel transplant; heart-transplant; graft versus host disease; chronic graft rejection; antibody light chain; mAb 1D9; CDR1; complementarity determining region 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse mAb 1D9 antibody light chain complementarity determining region 1.

The invention comprises a method of inhibiting graft rejection, graft versus host disease or chronic rejection of a transplanted graft. The wethod involves administering an antagonist of CC chemokine receptor 2 (CCR2) and optionally an immunosuppressive agent. The CCR2 antagonist may be an anti-CCR2 antibody (i.e. containing light and heavy chain complementarity determining regions from various non-human origins). CCR2 is known to be involved in the rejection of transplanted grafts. The method of the invention is useful for inhibiting graft rejection particularly allografts such as kidney, liver, lung, heart-lung, particularly and heart. The method of the invention is also useful for inhibiting graft versus host disease and for inhibiting chronic rejection of a transplanted graft. The present amino acid sequence represents a mouse made in the chain complementarity determining region 1

GENERAL INFORMATION:
APPLICANT: Bretten. Lee R.
APPLICANT: Poxt, Judith A.
APPLICANT: Allison, David Edward
TITLE OF INVENTION: Method of Administering an Antibody
FILE REFERENCE: 1855.2007-001
CURRENT APPLICATION NUMBER: US/09/748,960
CURRENT APPLICATION NUMBER: US 09/550,082
PRIOR APPLICATION NUMBER: US 09/550,082
PRIOR PILING DATE: 2000-04-14
NUMBER OF SEQ ID NOS: 14
SOFTWARE: PastSEQ for Windows Version 4.0
SEQ ID NO 9
LENGTH: 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB 9; Length 16;

Publication No. US20030068615A1
GENERAL INFORMATION:
APPLICANT: SAXINGER, CARL
TITLE OF INVENTION: POLYPEPTIDES THAT BIND HIV GP120 AND RELATED NUCLEIC
TITLE OF INVENTION: ACIDS, ANTIBODIES, COMPOSITIONS, AND METHODS OF USE
FILE REFERENCE: 215875
CURRENT APPLICATION NUMBER: US/10/084,813
CURRENT FILING DATE: 2002-02-27
PRIOR PLICALION NUMBER: PCT/US00/23505
PRIOR PLICALION DATE: 200-08-25
PRIOR PLICALION NUMBER: US 60/151,270
PRIOR PLILING DATE: 1999-08-27

-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Stangler J., Diroksen H., Keller R.,
"Identification and immunocytochemical localization of proctolin in
pericardial organs of the shore crab, Carcinus meenas.";
Peptides 7:67-72(1986).
-!- FUNCTION: STIMULATES CARDIAC OUTFUT AND HINDGUT MOTILITY,
MODULATES VISCERAL AND SKELETAL MUSCLE IN MANY ARTHROPODS.
-!- TISSUE SPECIFICITY: FOUND IN THE LATERAL WHITE NEURONS AND IN
THE CRAB PERICARDIAL ORGANS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SPECIES=P.americana;

NON_TER. 1
the 50 S subunit of an organelle ribosome (chloroplast).";
J. Biol. Chem. 275:28466-28483(2000).

- I. FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA.
- I. SUBCELLULAR LOCATION: CHLOROPLAST.
- I TISSUE SPECIFICITY: EXPRESSED IN ALL PLANT TISSUES.
- I. MISCELLANEOUS: ON THE 2D-CEL ITS MM IS: 16.5 KDA.
- I. MISCELLANEOUS: ON THE 1.10P FAMILY OF RIBOSOMAL PROTEINS.

identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDKs) of the catalytic antibody 12HI, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Garalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibody reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
